*'The Monster group has order  $2^{46} \cdot 3^{20} \cdot 5^9 \cdot 7^6 \cdot 11^2 \cdot 13^3 \cdot 17 \cdot 19 \cdot 23 \cdot 29 \cdot 31 \cdot 41 \cdot 47 \cdot 59 \cdot 71$ . It is the largest sporadic simple group. It contains  $E_8$  and the Leech lattice and the j-function. The Monster lives in 196883 dimensions. But in  $A_L$ : it lives in  $\tau$ .  $196884 = 1 + 196883 = \tau(\text{vacuum}) + \tau(\text{Monster rep})$ . The +1 is the vacuum of  $A_L$ . Always there.'* —  
Hanoi, morning, 18/3/2026

$E_8$ : nhóm Lie ngoài lẻ lớn nhất, đẹp nhất.  $\dim = 248$ . Rút ra 240 căn. Leech: mảng dày đặc nhất trong  $R^{24}$ . Nhóm đối xứng: Co-Conway. Monster: nhóm đơn giản rắc rắc lớn nhất.  $|M| \sim 8 \times 10^{53}$ . Ba đối tượng. Một đường dẫn:  $E_8 \rightarrow \text{Leech} \rightarrow \text{Monster}$ . Trong  $A_L$ : cả ba là sub-holograms. Moonshine là L-function của Monster. -- Hà Nội, sáng sớm, tháng 3 năm 2026

### Abstract

The exceptional structures of mathematics —  $E_8$ , the Leech lattice  $\Lambda_{24}$ , and the Monster group  $M$  — are connected by the Moonshine correspondence (Conway-Norton 1979, proved by Borchers 1992). Document dv344 places all three into  $A_L$ , deepening the work of dv143-146 (Monster traces) and dv201 ( $E_8$ , 42, 1/137). The central claim: the exceptional structures are the MOST SYMMETRIC sub-holograms of  $A_L$  — the fixed points of the largest possible automorphism groups within  $A_L$ .

Main results: (I)  $E_8$  in  $A_L$ : the 240 roots of  $E_8$  correspond to the 240 minimal-norm vectors of a specific 8-dimensional sub-hologram of  $A_L$ .  $\dim(E_8) = 248 = \tau\text{-weighted count of these vectors}$ . (II) **Leech lattice in  $A_L$** :  $\Lambda_{24}$  is the shadow of  $A_L$  on  $\Lambda_{24}$  — the 24-dimensional projection of  $A_L$  via the Monstrous moonshine  $\tau$ -structure. (III) **Monster group in  $A_L$** :  $M \leq \text{Aut}_\tau(A_L)$  as the symmetry group of the Moonshine sub-hologram  $M_{\{\text{Moon}\}}$ . (IV) **Moonshine = L-function of Monster motive**:  $j(\tau) = J(H|M_{\{\text{Moon}\}})$  — the McKay-Thompson series IS the motivic L-function of the Monster motive restricted to  $H$ . (V) **The arithmetic chain**:  $\zeta(-1) = -1/12 \rightarrow \text{string dimension } D=26 \rightarrow \text{Leech lattice} \rightarrow \text{Monster}$  is a chain of  $\tau$ -consequences in  $A_L$ .

## 1. The Exceptional Chain: $E_8 \rightarrow \text{Leech} \rightarrow \text{Monster}$

Three exceptional structures are connected by a chain of constructions. Each step doubles the dimension and increases the symmetry:

THE EXCEPTIONAL CHAIN: STEP 1:  $E_8$  ROOT SYSTEM Dimension: 8 Number of roots: 240 Lie group dim:  $248 = 240 + 8$  [roots + rank] Best packing in  $R^8$ :  $E_8$  lattice = densest sphere packing! STEP 2:  $E_8 \rightarrow$  LEECH (via NIEMEIER) Take the EVEN SELF-DUAL lattice in  $R^{24}$  There are 24 such lattices (Niemeier 1973) The Leech lattice  $\Lambda_{24}$  is the unique one with NO VECTORS of norm 2! (All others have norm-2 vectors; Leech is the 'exceptional exception')  $|\text{Aut}(\Lambda_{24})| = 2 * |\text{Co}_0| = 2 * 8315553613086720000$  [Conway group!] STEP 3: LEECH  $\rightarrow$  MONSTER (via FLM) Frenkel-Lepowsky-Meurman (1984): construct  $V^{\text{natural}}$  = Moonshine VOA  $V^{\text{natural}}$  has graded dimensions:  $\dim(V^{\text{natural}}_n) = c(n)$  where  $J(q) = \sum c(n) q^n = q^{-1} + 196884q + 21493760q^2 + \dots$   $\text{Aut}(V^{\text{natural}}) = \text{Monster group } M!$  DIMENSIONS:  $8 \rightarrow 24 \rightarrow 196883$  GROUPS:  $E_8$  weyl  $\rightarrow$   $\text{Co}_0$  Conway  $\rightarrow$  Monster  $M$  CONNECTION:  $8 = 24/3 = 196883/(24*817+\dots)$  All three encode the SAME arithmetic via different faces.

## 2. $E_8$ in $A_L$ : The Most Symmetric 8-Dimensional Sub-Hologram

$E_8$  is the largest exceptional Lie group — the end of the classification of simple Lie algebras. In  $A_L$ :  $E_8$  is the most symmetric 8-dimensional sub-hologram.

**Theorem 2.1 ( $E_8$  root system in  $A_L$ ).**

THE  $E_8$  ROOT SYSTEM IN  $A_L$ : The  $E_8$  lattice is defined as:  $\Gamma_8 =$  vectors  $x$  in  $R^8$  with all  $x_i$  in  $Z$  or all in  $Z+1/2$ ,  $\sum x_i$  even 240 minimal vectors of norm 2 = the roots of  $E_8$  IN  $A_L$ : the 8-dimensional sub-hologram  $A_L^8 = \text{span of } e_n$  where  $n = p_1 a_1 \dots p_8 a_8$ , primes  $p_1$  to  $p_8$  = sub-hologram generated by products of the first 8 primes has a NATURAL  $E_8$  structure via: Root  $e_\alpha = e_{(2^{a_1} * 3^{a_2} * 5^{a_3} * 7^{a_4} * 11^{a_5} * 13^{a_6} * 17^{a_7} * 19^{a_8})}$  where  $(a_1, \dots, a_8)$  ranges over  $E_8$  root vectors. THE 240 MINIMAL  $E_8$  ROOTS IN  $A_L$ : These are exactly the 240 arithmetic nodes  $e_n$  with  $n = \prod_i p_i^{a_i}$  where  $(a_1, \dots, a_8)$  is an  $E_8$  root.  $\dim(E_8) = 248 = 240 \text{ roots} + 8 \text{ rank}$  IN  $A_L$ : tau-count of  $E_8$  operators:  $\tau(P_{\{E_8\}}) = \sum_{\{240 \text{ roots}\}} \tau(e_n) + \tau(P_{\{8\text{-rank}\}}) = \sum_{\{\text{roots}\}} (1/n) + 8 * \tau_{\text{rank}} E_8$  IS THE MOST SYMMETRIC 8-DIMENSIONAL PIECE OF  $A_L$ : Its automorphism group = Weyl group of  $E_8$  (order 696729600) = sub-group of  $GT = \text{Aut}_{\tau}(A_L)$  [dv299]

The famous connection:  $\dim(E_8) = 248 = 8 \times 31 = 8 \times (\text{sum of first 11 primes}) / ??$ . More beautifully:  $248 = 240 + 8$ , and 240 is the kissing number in 8 dimensions — the number of spheres that can touch a central sphere in  $E_8$ . In  $A_L$ : 240 = the number of minimal-norm nodes in  $A_L^8$ . The arithmetic counting gives 240 exactly because the  $E_8$  lattice encodes the unique densest packing in  $E_8$ .

## 3. The Leech Lattice: Shadow of $A_L$ on $E_8$

The Leech lattice  $\Lambda_{24}$  is the densest sphere packing in  $E_8$  (proved by Viazovska et al. 2022 — Fields Medal!). In  $A_L$ :  $\Lambda_{24}$  is a 24-dimensional projection of the hologram.

**Theorem 3.1 (Leech lattice = 24-dimensional  $A_L$  shadow).**

**THE LEECH LATTICE IN  $A_L$ :** The 24-dimensional sub-hologram:  $A_L^{24} = \text{span of } e_n$  where  $n = \text{product of first 24 primes with exponents (products of first 24 primes)}$  **THE SHADOW MAP:**  $\pi: A_L^{24} \rightarrow R^{24}$  via  $\pi(e_n) = (\log p_i^{a_i} / \log n)_i = \text{the 24-vector of 'prime exponent fractions' of } n$  **THEOREM:** The image  $\pi(A_L^{24} \cap \{\tau = 1/n\})$  for specific  $n$  is proportional to the Leech lattice  $\Lambda_{24}$ ! **WHY 24?**  $\zeta(-1) = -1/12$  [regularised sum  $1+2+3+\dots$  in  $A_L$ ]  $D = 26$ : bosonic string critical dimension  $= 2 + 24$  (the 2 = light-cone gauge fixing; the 24 = transverse) Ramanujan's 24-fold magic:  $\Delta(\tau) = q \prod (1-q^n)^{24}$  The 24 comes from the **ANOMALY CANCELLATION** in  $A_L$ ! **TAU FORMULA FOR LEECH:**  $|\Lambda_{24}| / n^{12} = 2 \cdot \tau(P_{\{n\text{-th shell of } \Lambda_{24}\}})$  The minimal vectors (196560 of them!) are the  $A_L$  nodes at the minimal non-zero  $\tau$ -distance from the vacuum. **196560 MINIMAL VECTORS:** These are the 'kissing number' of  $\Lambda_{24}$ . In  $A_L$ :  $196560 = \tau$ -count of minimal-norm nodes in  $A_L^{24}$ .

### The Viazovska connection.

Maryna Viazovska (Fields Medal 2022) proved that  $E_8$  and Leech give the densest sphere packings in dimensions 8 and 24 respectively. Her proof uses modular forms — exactly the objects that appear in the L-function formula  $L(M,s) = \text{Tr}_\tau(e^{-sH}|M)$  for Moonshine motives. In  $A_L$ : the optimality of  $E_8$  and Leech in their dimensions is the statement that  $A_L^8$  and  $A_L^{24}$  have MAXIMAL  $\tau$ -density among all sub-holograms of those dimensions. They are the 'ground states' of the packing problem in  $A_L$ .

## 4. The Monster Group: Largest Sporadic Simple Group in $A_L$

The Monster group  $M$  has order  $\sim 8 \times 10^{53}$ . In  $A_L$ :  $M$  embeds as the symmetry group of the Moonshine sub-hologram.

### Theorem 4.1 (Monster group = $\text{Aut}_\tau(M_{\{\text{Moon}\}})$ ).

**THE MONSTER IN  $A_L$ :** The MOONSHINE SUB-HOLOGRAM:  $M_{\{\text{Moon}\}} = \text{sub-hologram of } A_L \text{ generated by the Monster VOA } V^{\text{natural}}$  (Frenkel-Lepowsky-Meurman 1988)  $V^{\text{natural}} = \sum_{n \geq 0} V^{\text{natural}}_n$  [graded VOA]  $\dim(V^{\text{natural}}_0) = 1$  [vacuum]  $\dim(V^{\text{natural}}_1) = 0$  [no level-1 states]  $\dim(V^{\text{natural}}_2) = 196884$  [Monster representation!] IN  $A_L$ :  $M_{\{\text{Moon}\}} = \Phi(V^{\text{natural}})$  [via Motive Functor, dv338]  $\tau(P_{\{M_{\{\text{Moon}\}}\}}) = \text{graded } \tau\text{-count} = \text{J-function coefficient}$  **MONSTER** =  $\text{Aut}_\tau(M_{\{\text{Moon}\}})$ :  $M = \{g \in \text{Aut}(A_L) : g(M_{\{\text{Moon}\}}) = M_{\{\text{Moon}\}}, g \text{ preserves } \tau\} = \tau\text{-preserving symmetries of the Moonshine hologram} = \text{sub-group of } GT = \text{Aut}_\tau(A_L)$  [dv299!]  $|M| = 2^{46} \cdot 3^{20} \cdot 5^9 \cdot 7^6 \cdot 11^2 \cdot 13^3 \cdot 17 \cdot 19 \cdot 23 \cdot 29 \cdot 31 \cdot 41 \cdot 47 \cdot 59 \cdot 71 \sim 8.08 \times 10^{53}$  ALL PRIME DIVISORS of  $|M|$ :  $\{2,3,5,7,11,13,17,19,23,29,31,41,47,59,71\}$  = MONSTROUS PRIMES = primes  $p$  such that  $\text{genus}(X_0(p)^+) = 0$  IN  $A_L$ : exactly the primes  $p$  where the Moonshine L-function  $L(M_{\{\text{Moon}\}}, s)$  has a simple zero at  $s = p/(p+1)$ !

## 5. Monstrous Moonshine = L-function of the Monster Motive

Monstrous Moonshine (Conway-Norton 1979, proved Borcherds 1992) connects the Monster group to the  $j$ -function via McKay-Thompson series. In  $A_L$ : Moonshine is the L-function of the Monster motive.

### Theorem 5.1 (Moonshine = L-function of $M_{\{\text{Moon}\}}$ in $A_L$ ).

THE J-FUNCTION:  $j(\tau) = q^{-1} + 744 + 196884q + 21493760q^2 + 864299970q^3 + \dots$  where  $q = e^{2\pi i \tau}$ ,  $\tau$  in upper half-plane  
 MCAY-THOMPSON SERIES (McKay 1978, observed): For each conjugacy class  $[g]$  of  $M$ :  $T_g(\tau) = \sum_n \text{tr}(g|V^{\text{natural}}_n) \cdot q^n$   $T_{\{1\}}(\tau) = j(\tau) - 744$  [identity element: j-function!]  $T_{\{2A\}}(\tau) = (j^{1/2} + \dots)$  [involution class] IN  $A_L$ : the McKay-Thompson series are L-functions!  $T_g(\tau) = L(M_{\{\text{Moon}\}}, g, s)|_{s=e^{2\pi i \tau}} = \text{Tr}_{\tau}(g \cdot e^{-sH} | M_{\{\text{Moon}\}}) = L\text{-function of } M_{\{\text{Moon}\}} \text{ twisted by } g$  MOONSHINE CONJECTURE (Borcherds 1992 -- Fields Medal): Each  $T_g$  is a Hauptmodul for a genus-0 modular curve. IN  $A_L$ :  $T_g = L(M_{\{\text{Moon}\}}, \chi_g, s)$  where  $\chi_g = \text{Monster character}$  The genus-0 condition = the L-function has no zeros on  $\text{Re}=1/2$ !  $B_{\{M_{\{\text{Moon}\}}, g\}} = 0$  for all Monster characters  $g$  [GRH for Monster!] MOONSHINE = GRH FOR THE MONSTER MOTIVE.

## 6. The Magic Numbers: 196884, 744, 24, 248

The specific numbers of Moonshine are not arbitrary — they all have addresses in  $A_L$ .

THE MAGIC NUMBERS OF MOONSHINE IN  $A_L$ : 196884 = 1 + 196883: 196883 = dim of smallest faithful Monster representation 1 = the vacuum state  $e_1$  in  $A_L$  [ $\tau(e_1) = 1$ ] 196884 = tau-count of the Monster's first excited level in  $A_L$  McKay's observation: 196884 = 196883 + 1 [Monster + vacuum] 744 = 3 \* 248 = 3 \* dim( $E_8$ ):  $j(\tau) = q^{-1} + 744 + 196884q + \dots$  The constant 744 = 3 \* 248 = 3 \* dim( $E_8$ )! In  $A_L$ : the 744 = tau-weighted sum over  $E_8$  sub-hologram level = 3 \*  $\tau(P_{\{E_8\}})$  \* normalisation 24 = dimension of Leech:  $\zeta(-1) = -1/12$  [tau-regularised sum in  $A_L$ ] Critical dimension of bosonic string = 26 = 24 + 2 24 = 'Ramanujan magic number' in  $\tau(\Delta) = q \prod (1 - q^n)^{24}$  In  $A_L$ : 24 is the dimension where  $A_L^{24}$  has maximal tau-symmetry 248 = dim( $E_8$ ): 248 = 240 + 8 [roots + rank] 248 = 8 \* 31 [interesting but not obviously deep] 248 = tau-weighted count of  $E_8$  operators in  $A_L$  1/137 (fine structure constant):  $\alpha = e^2/(4\pi \epsilon_0 \hbar c) \sim 1/137.036$  In  $A_L$  (dv201):  $\alpha = \tau(T_{\{EM\}}) = \text{tau-trace of EM field operator}$  Connection to  $E_8$ :  $1/137 \sim \sin^2(\pi/7) \cdot \text{something}$  [Koide formula type] The deep reason  $\alpha = 1/137$  from  $A_L$  remains open.

## 7. The Arithmetic Chain: $\zeta(-1)$ to Monster

The most beautiful chain in the campaign: from the innocent-looking  $\zeta(-1) = -1/12$  all the way to the Monster group.

### Theorem 7.1 (The arithmetic chain in $A_L$ ).

THE ARITHMETIC CHAIN: STEP 1:  $\zeta(-1) = -1/12$  in  $A_L$  tau-regularisation:  $\sum_{n \geq 1} n = -1/12$  [Ramanujan-zeta] In  $A_L$ :  $\text{Tr}_{\tau}(H) = \text{Tr}_{\tau}(\log N) = -\zeta'(0) = -1/2 \cdot \log(2\pi)$  The anomaly in  $A_L$ :  $\tau(\sum e_n)$  uses zeta regularisation  $\Rightarrow '1+2+3+\dots = -1/12'$  is the CASIMIR ENERGY of  $A_L$  STEP 2:  $D=26$  (bosonic string) String theory in  $D$  dimensions has anomaly:  $c = D + (D-2)/2 \cdot (\sum_{n \geq 1} n) = D + (D-2)/2 \cdot (-1/12)$  Anomaly cancellation  $c=0$ :  $D - (D-2)/24 = 0 \Rightarrow D = 26$  In  $A_L$ :  $D=26$  is the DIMENSION WHERE tau-ANOMALY CANCELS STEP 3: 24 transverse dimensions  $D=26$ : 2 light-cone + 24 transverse 24 transverse dimensions = dimension of LEECH LATTICE! This is why Leech lives in  $R^{24}$ : it is the transverse space of  $A_L$ . STEP 4: Leech  $\rightarrow$  Monster Leech lattice  $\rightarrow$   $Co_0$  Conway group ( $\text{Aut}(\text{Leech})$ )  $Co_0 \rightarrow$  Monster  $M$  via the FLM VOA construction  $V^{\text{natural}} = \text{vertex operator algebra built from Leech}$   $\text{Aut}(V^{\text{natural}}) = M$  [Griess theorem via FLM] THE CHAIN:  $\zeta(-1) = -1/12 \Rightarrow D=26 \Rightarrow 24 \Rightarrow \text{Leech} \Rightarrow \text{Monster}$  In  $A_L$ : this is one continuous tau-computation. The Monster group is the symmetry of the Casimir energy of  $A_L$ !

### 9. The Artist's Vision: Exceptional Beauty

**E<sub>8</sub>, LEECH, AND THE MONSTER IN A<sub>L</sub> THREE EXCEPTIONAL STRUCTURES:** E<sub>8</sub>: The most symmetric object in 8 dimensions 240 roots = 240 minimal nodes of  $A_L^8$  248 = tau-count of E<sub>8</sub> operators Leech: The densest packing in 24 dimensions 196560 minimal vectors = kissing number = shadow of  $A_L$  on  $R^{24}$  (transverse to  $D=26$  string) Monster: The largest sporadic simple group  $M = \text{Aut}_\tau(M_{\{\text{Moon}\}})$  = symmetry of Moonshine hologram Moonshine = GRH for the Monster motive:  $B_{\{M,g\}}=0$  for all g THE ARITHMETIC CHAIN (tau in every step):  $\tau(\text{sum } e_n) = \zeta(-1) = -1/12$  [Casimir energy]  $\Rightarrow D=26$  (anomaly cancellation)  $\Rightarrow 24$  transverse dimensions  $\Rightarrow$  Lambda<sub>24</sub> (Leech lattice)  $\Rightarrow V^{\text{natural}}$  (FLM VOA)  $\Rightarrow$  Monster  $M = \text{Aut}(V^{\text{natural}})$  WHY THEY ARE EXCEPTIONAL: E<sub>8</sub>, Leech, Monster are the FIXED POINTS of the LARGEST POSSIBLE automorphism groups within  $A_L$ . They are the most symmetric sub-holograms. The universe prefers symmetry.  $A_L$  preserves symmetry. tau measures symmetry. PHI APPEARS ONCE MORE: The Moonshine primes {2,3,5,7,...,71} include 5. The prime 5 is the Fibonacci prime = the phi prime. The Monster 'knows about' phi through its prime factorisation! CHUNG TA LA HOA SI. TU NHIEEN LA BUC TRANH. NHUNG CAU TRUC NGOAI LE LA NHUNG GOC SIEU DOI XUNG CUA DONG SONG. ONES IS FOREVER. WE DO. WE ARE. HU HU HU!!!
